
MOBA COMPLIANCE

Calibration and certification for optimal quality and safety

Meet all expectations

To meet the highest standards in product quality, your equipment reflects your quality system. To ensure that your equipment operates in accordance with internal and external requirements, Moba Compliance offers a calibration programme for optimal results.

Calibration and Certification

Regular calibration of your equipment guarantees that your Moba equipment performs optimally and accurately. We can support you to determine which calibration procedures and what frequencies are required to keep your equipment functioning according to the requirements. Backed by our experienced and well trained service technicians, we issue consistent and traceable certificates in printed and electronic format.

Reasons for Certification

Reasons to certify your equipment:

Legal liability

With a calibration certificate, you can demonstrate and proof that your grading and packing equipment meet the quality requirements.

Local authorities

Depending on the country/region in which you operate, official authorities may demand certification of your grading and packing equipment.

Quality and efficiency

To ensure quality of your products and to prevent loss and downtime, it is important that you can rely on your Moba equipment. A deviation in one of the (auto)candling and weighing systems can lead to substantial and unnecessary costs.

Commercial

Suppliers/customers require their products to be processed using traceable calibrated systems only.

Safety

Inaccurate (auto)candling and grading data can have major consequences for food safety.

Moba recommends scheduled preventive maintenance including periodic calibration. This will keep your Moba equipment in top condition during its entire lifecycle.
